Sydney, Nova Scotia B1P 6L2

A vascular plant survey of Scatarie Island, Nova Scotia was conducted from 8 to 11 August 2005. Our expedition gathered 77 vascular plant collections that were deposited in the Saint Francis Xavier (STFX) and Cape Breton University (CBUH) herbaria. A Scatarie Island Vascular Plant Checklist was compiled, combining our survey and three previous vascular plant surveys for a total of 309 species extending the checklist by 15 species. There are now 203 species on the checklist represented by voucher specimens and 106 species not represented by voucher specimens which remain on the list. The island supports a number of plant species that are of special interest because of their rarity in the region, especially those with an arctic or alpine affiliation.

Une étude des plantes vasculaires de l'île Scatarie, en Nouvelle-Écosse, a été effectuée du 8 au 11 août 2005. L'expédition a permis de recueillir 77 collections de plantes vasculaires qui ont été déposées dans les herbiers de l'Université Saint Francis Xavier et de la Cape Breton University. Une liste des plantes vasculaires de l'île Scatarie a été dressée, à partir de notre étude et de trois études précédentes menées sur les plantes vasculaires. La liste s'est enrichie de 15 espèces supplémentaires et compte au total 309 espèces. Sur ces 309 espèces, 203 sont maintenant représentées par des spécimens de référence et 106 espèces pour lesquelles on n'a pas de spécimens de référence restent sur la liste. L'île abrite plusieurs espèces végétales qui présentent un intérêt particulier compte tenu de leur rareté dans la région, particulièrement celles qui sont associées aux zones arctiques ou alpines.

INTRODUCTION

Scatarie Island is a provincial protected Wilderness Area located off the north-eastern coast of Cape Breton, Nova Scotia (Province of Nova Scotia 2006); the island is known for its rare bird and plant species (Cameron 2004). Most of the island is boreal forest, a char-

acteristic of locations near the Atlantic coast (Loucks 1961, Davis & Browne 1998). Near the coast the forest gives way to barrens, salt marshes, and wetlands while the hilly interior is covered with exposed taiga, bogs and fens. In most of these habitats, the same species of introduced and native plants are common on Scatarie Island as on the mainland; however, Scatarie Island is also home to many provincial rarities. These species are typically adapted to more northerly climates and persist in the harsh climate of Scatarie Island (Davis & Browne 1998). This checklist combines past vascular plant surveys with our recent survey to provide a current checklist of the Island's vascular flora which will aid future inquiry into the vascular plants and the ecosystem of Scatarie Island.

METHODS

Between 09 and 11 August 2005, Scatarie Island was explored on foot as part of a volunteer "Bioblitz" expedition. Collections of vascular plants were made within three kilometres of Northwest Cove, using an unpublished species checklist as a guide (Williams 2000). This checklist was compiled using unpublished records from previous explorations of Scatarie Island (Table 1). Plants were collected, habitat details were recorded, and plants were pressed immediately. Identifications were made in the field using Roland and Smith (1966, 1969), or in a herbarium with the aid of dissecting microscopes, using Roland (1998), and collections at Saint Francis Xavier (STFX) and Cape Breton University (CBUH).

Table 1 A list of previous collection trips to Scatarie Island. Date, collectors' names and repository of their specimens are supplied. ACAD = E. C. Smith Herbarium, Acadia University, Wolfville; CBUH = Cape Breton University Herbarium, Sydney; NSPM = Nova Scotia Provincial Museum, Halifax; STFX = St. Francis Xavier University Herbarium, Antigonish.

Year	Collectors	Herbarium
1951	Erskine, JS	NSPM
1951	Smith, EC, Schofield, WB, Sampson, DR, Bent, FC	ACAD
1953	Smith, EC, Schofield, WB, Taylor, JC, Webster, DH, Slipp, LB and Bently, PA	ACAD & NSPM
1953	Smith, EC, Taylor, JC, Webster, DH, Slipp, LB and Schofield, WB	ACAD & NSPM
1971	Godfrey, AP	none
1984	Williams, M	NSPM & CBUH
1992	Crins, WJ and McCorquodale, DB	CBUH
1995	Williams, M and Currie, N	CBUH & ACAD
2005	Ferrier, J, MacDonald, AAM and Taylor, BR	STFX & CBUH

The habitats sampled included dense coniferous forests, grassy dunes, coastal headlands and barrens, inland barrens, barrachois, bogs, and roadsides. On 09 August a route was explored starting at Northwest Cove through the forest and barrens to Tin Cove. From Tin Cove the route extended southeast along the coast and across the peninsula northeast of Howe Point. The route continued along the coast as far as Eastern Harbour and back to Northwest Cove. On 10 August three areas were explored: the coast at Savage point, the nearby plateau-taiga hilltops, and the forest and brackish lakes southeast of Northwest Cove.

Voucher specimens were deposited at STFX and CBUH, labelled with the plant's scientific and common names, collection date, GPS coordinates, habitat, collector, identifier, and a herbarium specimen number. All species names and authorities of past surveys were updated using Roland (1998).

RESULTS

The complete vascular plant checklist for Scatarie Island, including new collections, is given in Table 2. This list comprises 308 species in 68 families. Of these, fifteen species are new to the checklist. Specimens of twelve of these were collected: *Carex disperma*, *Epilobium hornemannii*, *Goodyera tesselata*, *Ilex glabra*, *Moneses uniflora*, *Monotropa uniflora*, *Plantanthera obtusata*, *Listera cordata*, *Pyrola elliptica*, *Scirpus acutus*, *Scirpus maritimus* and *Taxus canadensis*. We observed, but did not collect three previously unreported species: *Atriplex patula*, *Larix laricina* forma *depressa*, and *Typha latifolia*. Some 106 plants were included in the checklist based on unpublished sources (Table 1), despite the absence of voucher specimens.

We also found several colonies of rare plants and recorded their GPS coordinates, only collecting where plants were abundant (Table 3). We define rare plants as those that are numerically infrequent at some spatial scale. The Atlantic Canada Conservation Data Centre (ACCDC) maintains a list of rare plants in the province, while the Nova Scotia Department of Natural Resources (DNR) has classified most species according to the degree to which their provincial populations are at risk of extirpation, as green (secure), yellow (vulnerable) or red (threatened). Rarity is only one element determining whether a species is at risk.

We report three populations of *Vaccinium uliginosum* and one of *V. boreale*, as well as confirming the continued presence of *Cornus suecica* at Northwest Cove. The GPS coordinates in Table 3 can be used by future researchers to locate and monitor the survival of these populations.

Table 2 A vascular plant list for Scatarie Island. Data are compiled from unpublished sources, four Nova Scotia herbaria, and our own collections (†). Our new additions to the list are indicated with an asterisk (*). Numbers in columns indicate the number of specimens at each herbarium. Note that some species on the list are not represented by collections and have been included based on unpublished resources. We observed but did not collect three of these species (indicated with ~).

Table 3 Rare plants from Scatarie Island. The general location of the collection is given along with GPS co-ordinates and conservation status as given by Nova Scotia Department of Natural Resources (DNR) and the Atlantic Canada Conservation Data Centre (ACCDC). DNR ranks species as red (threatened) yellow (vulnerable) or green (secure). ACCDC ranks species as S1 (extremely rare), S2 (rare), S3 (uncommon), S4 (common) or S5 (abundant).

DISCUSSION

Boreal Forest Trees

Much of Scatarie Island is covered by the typical boreal forest found on the Atlantic coast of Nova Scotia (Loucks 1961, Davis & Browne 1998). Coniferous species *Abies balsamea* (Balsam Fir), *Picea glauca* (White Spruce) and *Picea mariana* (Black Spruce) dominate the forests. Deciduous hardwoods are less common; of these, *Betula papyrifera* (Paper Birch) and *Betula cordifolia* (Heart-leaved Birch) are frequent, *Sorbus americana* (American Mountain-Ash), *Populus tremuloides* (Trembling Aspen), and *Betula alleghaniensis* (Yellow Birch) are rare. The ground cover is commonly the Schreber's Moss association typical of this forest type (Davis & Browne 1998, Cameron 2004).

Arctic and Alpine Plant Species

Northern plants such as *Cornus suecica* and *Vaccinium uliginosum* are found on Scatarie Island; some colonies are near the extreme southern reaches of the species' range (Roland & Smith 1969, Davis & Brown 1998). These plants are often of interest because they are rare in Nova Scotia and are called the "arctic-alpine flora" (Hounsell & Smith 1966, 1968, Roland & Smith 1969, Pronych & Wilson 1993). The surrounding Atlantic Ocean causes the wind, fog and cool temperatures of Scatarie Island and allows these plants to persist south of their typical range. Scatarie Island has cooler summers and warmer winters relative to the rest of Nova Scotia (Cameron 2004). Many of Nova Scotia's rare plants are geographically disjunct populations, perhaps "stranded" here during periods of climate change (Bridgland 1989).

One stand of *C. suecica* was found during our expedition to Scatarie Island. The plants were growing densely with *Juniperus communis* on a cliff headland at Northwest Cove (Table 3). *C. suecica* is an alpine plant and typically occurs in the far north, including Greenland and parts of Eurasia (Roland & Smith 1969, Roland 1998). This plant is known in Nova Scotia only from collections around the Gulf of St. Lawrence, Scatarie Island, and a single record from Queen's County (Roland 1998).

We were able to locate several colonies of Alpine Whortleberry, *Vaccinium uliginosum* (Table 3). *V. uliginosum* is most common in the north between the 60th and 70th parallels, but extends as far south as New Hampshire (Roland 1998). In Nova Scotia this plant persists only where severe wind and exposed mountaintops hinder the growth of other plants (Davis & Browne 1998).

Our expedition found a single specimen of *Prenanthes nana* on a rock outcrop facing a windswept barren. *Prenanthes nana* is found

on the cool coastlines of Newfoundland and Labrador and Nova Scotia, and in the mountains of New England and northern New York; elsewhere it is rare (Roland & Smith 1969). It was collected previously by P. Williams (Table 2).

We did not find *Sparganium hyperboreum*, considered rare in Cape Breton (Roland & Smith 1966) and listed as a “yellow” (threatened) species by DNR (2009). *Sparganium hyperboreum* has been previously found growing abundantly in a bog pool at Northwest Cove (Roland & Smith 1966). This plant has a northern distribution, extending from Greenland to Eurasia and the Northwest Territories south to northern Nova Scotia, northern Quebec, Manitoba, and Alberta (Maher et al. 1978, Roland & Smith 1966).

Although *Rubus acaulis* (Arctic Raspberry, Northern Dwarf Raspberry) was not found during our expedition, it was listed previously for Scatarie Island (Godfrey 1971). The species is synonymous with *Rubus arcticus* ssp. *acaulis* (Michx.) Focke; however, neither species is listed as occurring anywhere in Nova Scotia (Roland 1998, ACCDC 2009). There is no herbarium voucher and therefore this description cannot be verified; future expeditions to Scatarie Island should consider the possibility of its presence.

Two additional plants from Scatarie Island, *Eleocharis nitida* and *Sparganium multipedunculatum*, were listed as rare by Pronych and Wilson (1993). However, both are now listed as secure in the DNR ranking (DNR 2009). *Sparganium multipedunculatum* has been declared synonymous with the more common species *S. angustifolium* (Roland 1998). The Scatarie Island population of *E. nitida* remains a disjunct location from the more abundant populations around the Bay of Fundy (Roland 1998).

Recent archaeological surveys suggest Scatarie Island was settled by Europeans as early as 1715. A 1716 census shows 405 people lived on the island (Chrestien 2001). Occupation of the island continued into the 20th century. There are a few, small, private land holdings on the island where cottages and camps may be found. As a result of this land use history, a number of plant species have been introduced to the island including the Old World species *Radiola linoides*, which in North America is known only from Nova Scotia (Roland 1998). This tiny (3 cm) plant grows near the coast in ditches, roadsides or waste ground. On Scatarie Island, we found this plant growing near *Cornus suecica*, high on a beach at Northwest Cove (Table 3).

CONCLUSION

This checklist is the most comprehensive list available of the vascular plants of Scatarie Island, now including 309 plant species. Our herbarium vouchers expand previous checklists and confirm the observations of previous surveyors (Table 1). Knowledge of the GPS coordinates of rare plants (Table 3) will facilitate further survey efforts necessary for an estimate of the abundance and viability of these populations. More species potentially could be added as well; our expedition added 15 previously unreported species to the island checklist in only four days and therefore the presence of more species is likely. In addition, many of the plant species records are not supported by voucher material (Table 2) and future collecting trips can confirm these records.

Scatarie Island comprises many habitats: exposed barrens, damp bogs, coniferous woods and abandoned homesteads. Its diversity of habitat, isolation from the mainland, and current status as a provincial Wilderness Area make it a compelling location for exploration. This checklist should facilitate future plant surveys attempting to find still more species, augment herbaria collections, track colonies of rare plants or develop a more quantitative description of the vegetation. We hope that this list will encourage further investigation into the ecology of plant populations and communities on Scatarie Island.

Acknowledgements. We thank Robert Cameron for field guidance and Dr. David Garbary and Catherine Sneddon for laboratory assistance. Dr. Dave McCorquodale provided invaluable direction and advice at all stages of this project.
